

DataClean Pro: An Automated Data Cleaning System

ABSTRACT

Data cleaning is an important step before data analysis, as raw datasets often contain duplicate records, missing values, inconsistent formatting, unnecessary spaces, and empty rows. Cleaning such data manually is time-consuming and prone to errors.

The **DataClean Pro: An Automated Data Cleaning System** is a web-based application that automates common data cleaning tasks. Users can upload a CSV file, select the required cleaning operations, and receive a cleaned dataset along with a summary of the changes made. The application is developed using **React, Flask, MySQL, and Pandas**, providing a simple and efficient solution for improving data quality while demonstrating file handling, database integration, API communication, and automated data preprocessing.
